

Self Reflection Project Analysis Phase

Tammy Gibson

2-9-20

During this phase of the project I had the opportunity to spend time meeting my new team members. I can tell that we each have different levels of experience working in programming and development. I am glad to see that we have good communication so far and we were able to choose a work topic quickly. Nathan has really taken the lead by initiating the work so far and keeping the team going with a forward momentum. Though I do not have hands on experience with building software I am able to follow along with what the group is trying to accomplish. I found the most difficult part of the project so far to be determining the best management method for the project. Some of us are comfortable with agile workflows and some are not. However, it seems we have settled into a watered-down agile type workflow. I feel with continued great communication and scheduling the project will move along smoothly. I was able to make a work breakdown sheet which I had not made so in depth before. I spent some time review project management skills to refresh my knowledge on the software development lifecycle. I contributed the work breakdown chart and work breakdown dictionary.
